PROFESSIONAL SUMMARY

Computer Science undergraduate with strong foundations in programming, analytical problem-solving, and system-level understanding. Hands-on experience building an end-to-end AI wellness platform during a PS-1 internship, covering machine learning (XGBoost, LightGBM), backend APIs, and a full-stack dashboard, alongside academic work in database design, business analysis, and user-focused design. Clear technical communicator who works effectively in collaborative, project-driven environments.

EDUCATION

B.Tech in Computer Science
JK Lakshmipat University, Jaipur | 2024 – 2028

TECHNICAL SKILLS

Programming Languages: C, C++, Python, JavaScript
Machine Learning: XGBoost, LightGBM, Optuna (hyperparameter tuning), feature engineering, model evaluation
Backend & Databases: FastAPI, REST APIs, SQLAlchemy, SQLite, MySQL, Redis (caching), Pydantic
Frontend: React (Vite), HTML, CSS, SVG data visualization
Tools & Platforms: Docker, VS Code, Git/GitHub, Vercel, pytest

EXPERIENCE

PS-1 Internship – WellMate: AI-Powered Student Wellness Platform | 18 May 2026 – 3 Jul 2026

Designed and built an AI wellness system that models a student's mental health and academic life as a "digital twin", predicts burnout risk, and recommends personalised recovery missions.

- **Student Digital Twin (SDT) – state engine:** Built a FastAPI service maintaining a 10-dimensional state vector (stress, fatigue, anxiety, sleep, mood, focus, burnout, and more) using an exponential-decay and Kalman-gain update model. Added AES-256 encrypted, append-only history with weekly key rotation, out-of-order replay, and automated tests asserting updates under 10 ms. Code | Live demo
- **Multi-Outcome Prediction Engine (MOPE) – ML inference:** Trained XGBoost and LightGBM models, tuned with Optuna and 5-fold cross-validation on a 10,500-sample calibrated dataset, to predict burnout probability, anxiety level, and depressive onset index. Achieved **0.98 AUC-ROC and 0.91 F1** for burnout and **0.033 MAE** for depressive onset. Engineered features including LOCF imputation, 7-day stress delta, sleep-to-stress ratio, and rolling statistics; added anomaly and clinical-threshold alerts with Redis caching. Code | Live demo
- **WellMate web app – full-stack product:** Built the student-facing dashboard with an AI daily briefing, explainable "why you feel this way" diagnostics, a 7-day burnout risk forecast, an AI companion, journaling, analytics, and a gamified Mission Center with points, streaks, and weekly challenges. Code
- Designed the end-to-end architecture: data collection (voice, journal, daily logs) → conversational parameter extraction → digital twin → prediction → explainability → personalised intervention → feedback loop that updates the twin.

PROJECTS

1. Placement & Internship Management Database – Developed a structured relational DBMS model and gained understanding of entity design, relationships, and efficient data handling.

2. BusKaro – Shared Mobility Business Project – Created an innovative shared-bus mobility concept through market analysis, user-gap identification, and business-model development.

3. Consumer Empowerment Platform – Built an interactive web platform centered on user empowerment, improving UI/UX design, front-end structuring, and user-centric design skills.

ACHIEVEMENTS & ACTIVITIES

- Coordinated and volunteered in university-level cultural, sports, and technical events, including internal hackathon arrangements.
- Completed communication-focused coursework that strengthened clarity in writing, presentations, and collaborative work.
